APHASIA CHOIR

We understand that losing valuable time to inappropriate and ineffective treatments after a loved one loses their words to stroke or head injury is frustrating.

Our Aphasia Choir provides an opportunity to use one’s strengths and engage with others who are share the same struggles.

Evidence-based music therapy approaches are proven to help people to make progress after they have stopped seeing results with other therapies.

The Top Three Benefits of Our Clients Experience

#1 Improved Speech
Music therapy has a measurable effect on helping those experiencing speech difficulties after a traumatic brain injury. We use singing-based techniques to help patients get their words out clearly.

#2 Better Moods
Studies show that music can enhance moods after a stroke, and our participants also get a natural mood boost by being surrounded by a circle of supporters as they work toward their goals.

#3 Social Interaction
Our choir is the perfect setting for a person with aphasia to get some social interaction. The music helps facilitate improved speech and the music itself can help communicate things that words can’t.

Why Our Clients Love Us

“We have seen a great improvement in my sister since she started the music therapy. She is now able to sing songs and even communicate with words and sentences. It warms my heart when she says “I love you.”

- Sister of Former Client

Our team offers more than 25 years of experience and can help your loved one adopt therapy that will stimulate the brain’s function controlling movement, cognition, speech, emotions, and the senses.

We are trusted experts in our field and we contribute to bodies of evidence used by providers nationally and internationally to make treatment decisions.

This mastery allows us to bring together the most innovative techniques available in a way that is motivating and enjoyable.
